## Management of Neonatal Jaundice

Staff relevant to:	Medical & Nursing staff working within the UHL Children's Hospital caring for babies presenting with neonatal jaundice
Team approval date:	November 2022
Version:	5
Revision due:	November 2025
Reviewed by:	N Muhammad
Trust Ref:	C32/2019

### 1. Introduction and who this guideline applies to

**This guideline does not provide advice on treatment of jaundice outside of the early neonatal period (14 days in term infants and 21 days if premature).**

#### Related documents:

- [Jaundice - Prolonged UHL Childrens Hospital Guideline Trust ref: C17/2017](#)
- [Examination of the Newborn on the Postnatal Ward UHL Neonatal Guideline Trust ref: C98/2008:](#)

Jaundice (aka hyperbilirubinaemia) refers to the yellow colouration of the skin and the sclera caused by the accumulation of bilirubin. For most babies, jaundice is physiological and usually harmless. However, pathological jaundice requires appropriate investigation and treatment.

Approximately 60% of healthy term and 80% of preterm babies develop jaundice in the first week of life, and about 10% of breastfed babies are still jaundiced at 1 month. Neonates are prone to physiological jaundice as they are relatively polycythaemic with high red cell turnover and immature liver and gut flora.

This guideline is for use by Medical & Nursing staff working within the UHL Children's Hospital caring for babies presenting with neonatal jaundice referred to hospital via the community midwife, ANNP clinic, health visitor or GP.

## 2. Management of Neonatal Jaundice

# Neonatal Jaundice Management

## 2.1 Don't miss:

Jaundice is pathological in the following situations:

1. **The child is unwell**
  - Sepsis must be treated and investigated as per UHL guidelines
2. **Within the first 24 hours of life**
  - Highly suggestive of haemolysis, sepsis or dehydration and requires inpatient investigation and treatment
3. **Jaundice levels sufficiently high to require treatment**
  - Risk of bilirubin crossing the blood brain barrier and facilitating encephalopathy (aka kernicterus)
4. **Prolonged jaundice (>14 days in term infants and 21 days if premature)**
  - See Prolonged Jaundice guideline

<http://www.qosh.nhs.uk/file/7151/download?token=bO1f4K8M>

## 2.2 Treatment:

During phototherapy:

- Ensure treatment is applied to the maximum area of skin
- Give the baby eye protection and routine eye care
- Using clinical judgement, encourage short breaks (of up to 30 minutes) for breastfeeding, nappy changing and cuddles
- Continue lactation/feeding support
- Do not give additional fluids

Intravenous immunoglobulin:

- Adjunct to continuous intensive phototherapy whilst arranging exchange transfusion
- Dose: 500mg/kg over 4 hours
- Indications:
  - ABO/rhesus haemolytic disease AND
  - SBR continues to >8.5µmol/L per hour

Double-volume exchange transfusion:

- **Note: this procedure should be conducted on CICU**

- Indications:
  - SBR above the exchange line
  - and/or with clinical features of acute bilirubin encephalopathy
- During exchange transfusion **do not:**
  - Stop continuous intensified phototherapy
  - Perform a single-volume exchange
  - Use albumin priming
  - Routinely administer intravenous calcium
- Following exchange transfusion:
  - Maintain continuous intensified phototherapy
  - Measure gas bilirubin within 2 hours and manage according to the treatment threshold graphs.
- Offer parents or carers information on exchange transfusion including:
  - The baby will require admission to the intensive care unit
  - Why the procedure is required
  - Possible adverse effects
  - When it will be possible for parents or carers to see and hold the baby after the procedure

### 2.3 Discharge criteria and advice

- Patients can be safely discharged home when the gas bilirubin is  $>50\mu\text{mol/l}$  below the phototherapy line apart from those with jaundice within the first 24 hours of life who require close inpatient observation
- Patients are not required to stay as inpatients for the rebound gas bilirubin and can be discharged to return for rebound as needed (see below)
- **Repeat SBR should be arranged as follows when needed:**
  - If available, repeat gas bilirubin can be done in day care;
  - otherwise the patient should return to the base ward for repeat gas bilirubin as needed.
  - Only patients who were seen in ED and did not require admission for phototherapy but who require a repeat gas bilirubin should return to ED for repeat
- Please ensure arrangement of repeat gas bilirubin are at a suitable time for parents and staff within the specified time frame.
- Parents should be advised to seek advice if the child is unwell or there is an increasing level of jaundice

### 3. Education and Training

Ensure all healthcare professionals commencing phototherapy are competent in setting up the equipment.

### 4. Monitoring and Audit Criteria

What will be measured to monitor compliance	How will compliance be monitored	Monitoring Lead	Frequency	Reporting arrangements
Babies with hyperbilirubinaemia are started on treatment in accordance with standardised threshold tables or charts	Audit of case notes	Consultant	2 Yearly	Clinical audit meeting

Appendix 2. Use of Transcutaneous Bilirubinometers (TcB) in the community for babies  $\geq 35$  weeks gestation and over 24 hours (taken from [Jaundice in Newborn Babies UHL Obstetric Guideline](#))

**If a baby is referred for a TcB or serum bilirubin measurement and does not attend notify the community midwifery office on 01162584834 or email [uho-tr.communitymidwifeoffice@nhs.net](mailto:uho-tr.communitymidwifeoffice@nhs.net)**

Appendix 3. Table 1: When does a TcB need repeating in the community? (taken from [Jaundice in Newborn Babies UHL Obstetric Guideline](#))

Assessment number	Gestation	Amount Bilirubin is below treatment threshold	Action
1 <sup>st</sup> Community reading	≥38 weeks	≤ 50	Repeat within 24 hours or 18 hours if risk factors present
		> 50	Repeat not needed
	35-37 weeks completed weeks	≤ 50	Repeat the next morning
		> 50	Repeat within 24 hours or 18 hours if risk factors present
2 <sup>nd</sup> Community reading	≥38 weeks	≤ 50	Repeat within 24 hours or 18 hours if risk factors present
		> 50	Repeat not needed
	35-37 weeks completed weeks	≤ 50	Repeat the next morning
		>50	Repeat not needed
3 <sup>rd</sup> Community reading	Any	Below treatment threshold	Result still < treatment level and baby well – repeat reading if visibly jaundiced and review on Day 14  Advise parents to make contact if they have any concerns prior to this

- Any baby with jaundice in the first 24 hours needs to be discussed with the paediatric registrar and referred via the single front door or referred to the duty team in hospital, these babies **require an urgent SBR(gas bilirubin)**
- Any baby with jaundice levels above treatment level needs to be referred to the ANNP clinic or Paediatric Registrar (out of hours) following a face to face assessment
- ANNP clinic runs Mon-Fri 9-5pm, outside these times referrals go via the single front door
- Consider previous jaundice levels when making your assessment and assess the rate of rise and consider how rapidly levels are likely to rise. Plot on the NICE threshold chart and contact ANNP or Paediatric Registrar (outside of ANNP clinic hours)if concerned
- Conduct a full clinical assessment ([page 7Jaundice in Newborn Babies UHL Obstetric Guideline](#)) if either you or baby’s parents have concerns
- Be aware of risk factors that might make bilirubin levels rise faster than usual

**If unsure what to do at any stage discuss with ANNP**
